

# DON'T-CARE CONDITIONS

- In some applications the function is not specified for certain combinations of the variables.
  - Eg: the four-bit binary code for the decimal digits has six combinations that are not used and consequently are considered to be unspecified.
- Functions that have unspecified outputs for some input combinations are called *incompletely specified functions*
- *In most applications*, we simply don't care what value is assumed by the function for the unspecified minterms.
  - For this reason, the unspecified minterms of a function are called *don't-care conditions*.
- *These don't-care conditions can be used on a map to provide further simplification of the Boolean expression.*

# DON'T-CARE CONDITIONS

- A don't-care minterm is a combination of variables whose logical value is not specified.
- To distinguish the don't-care condition from 1's and 0's, an X is used.
- Thus, an X inside a square in the map indicates that we don't care whether the value of 0 or 1 is assigned to  $F$  *for the particular minterm*.
- In choosing adjacent squares in K-map to simplify the function in a map, the don't-care minterms may be assumed to be either 0 or 1.
  - When simplifying the function, we can choose to include each don't-care minterm with either the 1's or the 0's, depending on which combination gives the simplest expression.

# DON'T-CARE CONDITIONS

- Simplify the Boolean function

$$F(w, x, y, z) = \sum (1, 3, 7, 11, 15)$$

which has the don't-care conditions

$$d(w, x, y, z) = \sum (0, 2, 5)$$

**Map 1:**

- Don't-care minterms 0 and 2 are included
  - $F = yz + w'x'$

**Map 2:**

- Don't-care minterm 5 is included
  - $F = yz + w'z$

- $F(w, x, y, z) = yz + w'x' = \sum (0, 1, 2, 3, 7, 11, 15)$

$$F(w, x, y, z) = yz + w'z = \sum (1, 3, 5, 7, 11, 15)$$

- Both expressions include minterms 1, 3, 7, 11, and 15 that make the function  $F$  equal to 1.

- The two expressions represent two functions that are not algebraically equal
  - Both cover the specified minterms of the function, but each covers different don't-care minterms.
  - As far as the *incompletely specified function* is concerned, either expression is acceptable because the only difference is in the value of  $F$  for the don't care minterms.

A 4x4 Karnaugh map for variables w, x, y, z. The vertical axis is labeled w (00, 01, 11, 10) and the horizontal axis is labeled x (00, 01, 11, 10). The top-left corner is labeled yz. The map shows minterms m<sub>0</sub> through m<sub>15</sub>. Minterms 0, 2, 5, 7, 11, and 15 are marked with '1'. Minterms 1 and 3 are marked with 'X' (don't-care). The expression F = yz + w'x' is shown below the map.

$$F = yz + w'x'$$

A 4x4 Karnaugh map for variables w, x, y, z. The vertical axis is labeled w (00, 01, 11, 10) and the horizontal axis is labeled x (00, 01, 11, 10). The top-left corner is labeled yz. The map shows minterms m<sub>0</sub> through m<sub>15</sub>. Minterms 1, 3, 5, 7, 11, and 15 are marked with '1'. Minterms 0 and 2 are marked with 'X' (don't-care). The expression F = yz + w'z is shown below the map.

$$F = yz + w'z$$

# DON'T-CARE CONDITIONS

- Simplify the Boolean function

$$F(w, x, y, z) = \sum (1, 3, 7, 11, 15)$$

which has the don't-care conditions

$$d(w, x, y, z) = \sum (0, 2, 5)$$

– simplified expression in product-of-sums form:

- $F(w, x, y, z) = z(w' + y) = \sum (1, 3, 5, 7, 11, 15)$ 
  - In this case, we include minterms 0 and 2 with the 0's
